

Top Investors Analysis

- The script `run.py` first loads data from csv file and check for data validations.
- Then the function `top_investors` identifies unique investments by each investor, then counts the number of unique syndicates each investor has invested in.
- It also calculates the total investment amount for each investor.
- Finally, it merges these two pieces of information and selects the top 5 investors based on the number of unique syndicates they have invested in.
